

# SELENIUM

COMMANDS TO WORK WITH

# INSTALLATION OF SELENIUM

- Move to the site [www.seleniumhq.org](http://www.seleniumhq.org)

# RULES FOR AUTOMATION

- Tests should always have a known starting point. Like opening a certain page to start a workflow.
- Tests should not have to rely on any other tests to run.
- This is to ensure that if something goes wrong in one test, it will not mean you have a lot of unnecessary failures to check.
- Tests should only test one thing at a time.
- Tests should clean up after themselves.

# BASE URL

- <https://book.theautomatedtester.co.uk>

# Open

- "Open" is most commonly used command in selenium IDE software testing tool.
- "Open" command opens the URL whatever you want to open in your current selected browser window or tab.

# ASSERTING ITEMS ON THE PAGE

- There are two mechanisms for validating elements available on the application under test.
- **Assert** - it allows the test to check if the element is on the page. If it is not available then the test will stop on the step that failed.
- **Verify** – it allows the test to check the element is on the page, but if it isn't then the test will carry on executing.

# LOCATORS IN SELENIUM

- Locators allow us to find elements on a page that can be used in our tests.
- Locate elements by ID
- Locate elements by Name
- Locate elements by Link

Button with ID

The screenshot shows a web browser's developer tools interface. The top navigation bar includes tabs for Console, HTML, CSS, Script, DOM, Net, Firefinder, and YSlow. The HTML tab is active, displaying the document's structure. A tree view on the left shows the hierarchy: `div#divontheleft < div.mainbody`. The selected element is an `<input id="but1" value="Button with ID">` tag, which is highlighted in blue. The right-hand pane shows the 'Style' tab, displaying the CSS rules applied to the selected element. It lists two styles: one inherited from `div#divontheleft.leftdiv` (font-size: 18px) and another inherited from `div.mainbody` (color: white, font-size: 12px).

Console HTML CSS Script DOM Net Firefinder YSlow

Edit | Input#but1 < div#divontheleft < div.mainbody

```
Beginners Guide</div>
<div class="mainbody">
  <div id="find">
  <div id="divontheleft" class="leftdiv">
    <input id="but1" value="Button with ID">
  </div>
</div>
```

Style Computed Layout DOM

Inherited from div#divontheleft.leftdiv

```
.leftdiv {
  font-size: 18px;
}
```

Inherited from div.mainbody

```
.mainbody {
  color: white;
  font-size: 12px;
}
```

# PATTERN MATCHING

- We are going to have a look at verifying that the exact text is in an element.
- This is done by using a special prefix `exact:` in front of the item.

# Working with Globs

- We have used exact to confirm the same matches in our tests.
- It will be quite tough when you want to test something in a div but the surrounding text might change suddenly.
- It can be dealt with technique called globbing which is similar to regular expression.
